

Mail that does more - SEAL for Mail

Email, improved with Vereign SEAL - Overview

Vereign

vereign.com/seal/mail

Mail with Vereign SEAL can do so much more:

- **Mail that can prove**

Each email is individually sealed against the blockchain, delivering a much higher standard of proof than traditional registered mail with all the convenience of email itself.

- **Mail that can archive**

Each email and all attachments are broken into encrypted fragments that are stored in the Interplanetary File System, a decentralised swarm of peer to peer storage. Censorship resistant, protected against manipulation.

- **Mail that can sign**

Due to the high standard of proof and archival, digital signatures on most contracts are fast and convenient by email. Just seal the respective messages including contract and expressed intent of acceptance and signing.

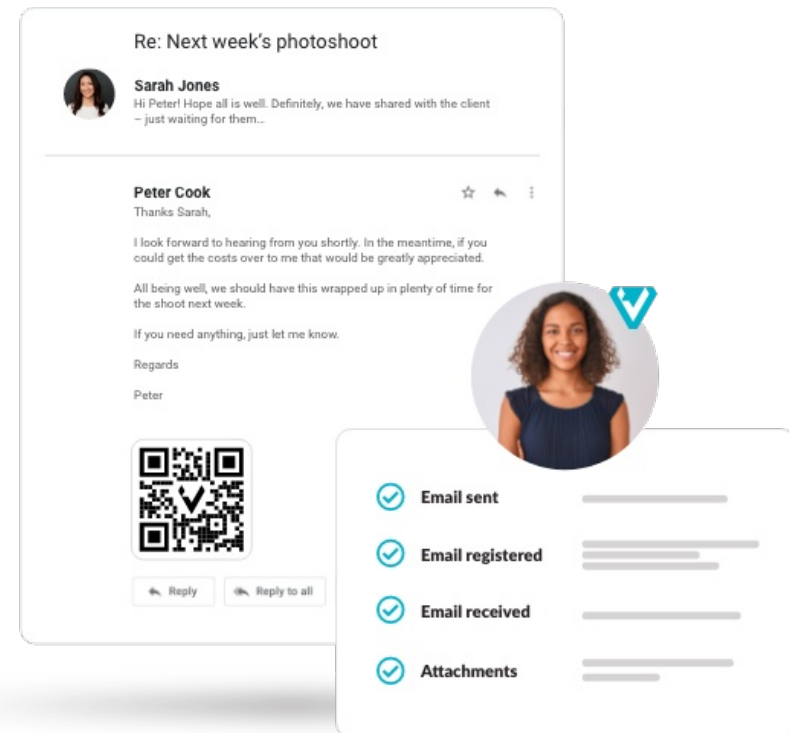

- **Mail that can share**

SEALs can be shared as image or link across any medium, sharing the original content and evidentiary value.

- **Mail that can protect**

Sealing your messages protects your name and reputation against impersonation and social phishing attacks.

Vereign SEAL for Mail comes natively integrated with add-ins into **Microsoft Outlook, M365** and **Google Mail on Chrome**. It is universally usable from any client or device by simply adding seal@vereign.com to the recipients of an email you want to seal against the blockchain.

Mail that does more - SEAL for Mail

Email, improved with Vereign SEAL - Companies

Vereign

vereign.com/seal/mail

At corporate level, SEAL for Mail provides an elegant solution to a variety of use cases that previously required their own, dedicated systems and support staff, such as

- Registered mail
- Revision secure email archival
- Electronic signature and acceptance management

Value added Service Opportunity

Traditional trusted service providers, such as post offices, banks, certificate authorities, but also accounting and other enterprise software vendors can leverage their well deserved reputation and use SEAL for Mail to add value in the decentralised data economy.

Powered by SEAL Verifiable Data Credentials

Vereign SEAL for Mail is powered by SEAL Verifiable Data Credentials, a technology layer that combines the versatility of QR codes with decentralized applications, storage and ledgers. Modern cryptography protects both the data and applications, making SEAL extremely tamper resistant, with no central data bases or applications to compromise.

More information about Verifiable Data Credentials and its other use cases is available at <https://vereign.com/seal>.

Professionally Supported

Vereign SEAL for Mail is available as fully supported product including guaranteed security updates, assured response and resolution times.

Vereign also offers the whole range of professional services, including integration, consultancy, development, and training.
